PT   New dog P-glycoproteins (PGP) and their encoding nucleic acids, useful
PT   for determining the bioavailability of drugs and for screening for dog
PT   PGP inhibitors -
XX
PS   Claim 1; Page 66-72; 111pp; English.
XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) cDNA. The
CC   PGP enzyme functions as an efflux pump exporting small molecules
CC   across the cell membrane. This enzyme is a member of the ABC
CC   transporter family.

CC   The present cDNA sequence encodes rat multidrug resistance
CC   protein 1a (mdr1a). This protein is a member of the multi-specific drug
CC   transporters family. Mdr1a is used in assays to provide information on
CC   drug formulation, selection of formulation excipients and compound
CC   design. They are used in cell based, membrane based, binding or other
CC   assays to provide information that may enhance drug formulation. This
CC   invention further relates to the generation of in vivo and in vitro
CC   comparison data to predict oral absorption and pharmacokinetics. This
CC   enables the selection of drugs with optimal pharmacokinetics, i.e. good
CC   oral bioavailability, brain penetration, plasma half life, and minimum
CC   drug interaction. Transgenic and knock-out animals created using rat
CC   mdr1a provides an insight into treating and preventing human diseases
CC   including cancer, inflammation, cardiovascular disease, central nervous
CC   system disorders, auto-immune and kidney disease.

XX
CC   The present cDNA sequence encodes rat multidrug resistance protein 1a
CC   (mdr1a). This cDNA is derived from EST (expressed sequence tag)
CC   sequences. Mdr1a is used in assays to provide information on
CC   drug formulation, selection of formulation excipients and compound
CC   design. They are used in cell based, membrane based, binding or other
CC   assays to provide information that may enhance drug formulation. This
CC   invention further relates to the generation of in vivo and in vitro
CC   comparision data to predict oral absorption and pharmacokinetics. This
CC   enables the selection of drugs with optimal pharmacokinetics, i.e. good
CC   oral bioavailability, brain penetration, plasma half life, and minimum
CC   drug interaction. Transgenic and knock-out animals created using rat
CC   mdr1a provides an insight into treating and preventing human diseases
CC   including cancer, inflammation, cardiovascular disease, central nervous
CC   system disorders, auto-immune and kidney disease.

PT   Ex vivo expansion of hematopoietic stem cells transduced with a

PT   transplantation -
XX
PS   Claim 10; Page 68-70; 113pp; English.
XX
CC   This sequence represents cDNA encoding human wild-type
CC   multidrug resistance protein MDR-1. MDR-1 is a transmembrane
CC   efflux pump, responsible for the export of drugs from cells,
CC   particularly cancer cells. Wild-type MDR-1 shows increased
CC   resistance to etoposide and decreased resistance to vinca
CC   alkaloids compared with a mutant form (AAY58187) where the Gly at
CC   position 185 is replaced by Val. The invention relates to transducing
CC   haematopoietic stem cells with nucleic acid encoding an MDR protein
CC   and culturing the modified cells. The modified haematopoietic stem
CC   cells are useful in bone marrow transplantation (to reconstitute
CC   haematopoietic systems in patients who have undergone chemotherapy or
CC   radiation therapy) and in ex vivo gene therapy of genetic defects in
CC   cells derived from haematopoietic stem cells, e.g., thalassaemia,
CC   Gauchier's disease, sickle cell anaemia or leukaemia. The modified
CC   cells can also be used to identify factors involved in regulating
CC   proliferation and differentiation in haematopoietic stem cells.
CC   Haematopoietic stem cells that express MDR-1 will be protected against
CC   chemotherapeutic agents, so can be engrafted while the patient is
CC   undergoing chemotherapy. Expansion of (rare) haematopoietic stem cells
CC   provides sufficient cells to permit standard biochemical analysis.
CC   Overexpression of MDR-1 allows cytokine-driven expansion of
CC   haematopoietic stem cells by at least 10-fold compared with a maximum
CC   of 4-fold in known procedures.

PT   Identifying a stem cell, for treating e.g., muscular dystrophy,
PT   myocardial infarction, Parkinson's disease, or neurodegenerative
PT   disorders, comprises detecting the expression of an ATP transport
PT   protein (BCRP) by a cell  -
XX
PS   Disclosure; Page 53-55; 87pp; English.
XX
CC   The invention provides a method of identifying and/or isolating a stem
CC   cell that involves detecting the expression of an ATP transport protein
CC   containing a conserved ATP-binding cassette (BCRP) by a cell in a sample
CC   comprising stem cells. The isolated stem cells may be used in the
CC   treatment of diseases such as muscular dystrophy, degenerative liver
CC   disorder, myocardial infarction, Parkinson's disease, degenerative
CC   disorders of the brain, and for tissue regeneration or replacement.
CC   Haematopoietic cells can be used in bone marrow transplants (e.g., for
CC   treatment of leukemia) and for ex vivo gene therapy for treating blood
CC   diseases such as sickle cell anemia and thalassemia. The stem cells can
CC   also be used as cell targets in gene therapy protocols. The present
CC   sequence represents a sequence related to the BCRP for which no relevant
CC   information has been provided in the specification.

PT   Identifying a stem cell, for treating e.g., muscular dystrophy,

CC   The invention provides a method of identifying and/or isolating a stem
CC   cell that involves detecting the expression of an ATP transport protein
CC   containing a conserved ATP-binding cassette (BCRP) by a cell in a sample
CC   comprising stem cells. The isolated stem cells may be used in the
CC   treatment of diseases such as muscular dystrophy, degenerative liver
CC   disorder, myocardial infarction, Parkinson's disease, degenerative
CC   disorders of the brain, and for tissue regeneration or replacement.
CC   Haematopoietic cells can be used in bone marrow transplants (e.g., for
CC   treatment of leukemia) and for ex vivo gene therapy for treating blood
CC   diseases such as sickle cell anemia and thalassemia. The stem cells can
CC   also be used as cell targets in gene therapy protocols. The present
CC   sequence represents a sequence related to the BCRP for which no relevant
CC   information has been provided in the specification.

CC   This invention relates to a polynucleotide sequence encoding a
CC   cynomologous monkey P-glycoprotein (PGP), and an allelic variant of the
CC   PGP protein. PGP, also known as multidrug transporter, MDR1 is a member
CC   of the ABC transporter superfamily. The enzyme serves as an efflux pump
CC   exporting small molecules across the cell membrane. The invention
CC   includes a cynomologous monkey (Macaca fascicularis) PGP coding sequence
CC   and protein, and also that of an allelic variant. The PGP polynucleotide
CC   sequence is useful for increasing PGP transporter activity in a cell.
CC   Antisense sequences of the cDNA are useful for inhibiting PGP transport
CC   activity in a mammalian cell. They may also be used for increasing the
CC   bioavailability of a drug. The present sequence represents cDNA encoding
CC   cynomologous monkey P-glycoprotein.

CC   This invention relates to a polynucleotide sequence encoding a
CC   cynomologous monkey P-glycoprotein (PGP), and an allelic variant of the
CC   PGP protein. PGP, also known as multidrug transporter, MDR1 is a member
CC   of the ABC transporter superfamily. The enzyme serves as an efflux pump
CC   exporting small molecules across the cell membrane. The invention
CC   includes a cynomologous monkey (Macaca fascicularis) PGP coding sequence
CC   and protein, and also that of an allelic variant. The PGP polynucleotide
CC   sequence is useful for increasing PGP transporter activity in a cell.
CC   Antisense sequences of the cDNA are useful for inhibiting PGP transport
CC   activity in a mammalian cell. They may also be used for increasing the
CC   bioavailability of a drug. The present sequence represents cDNA encoding
CC   cynomologous monkey P-glycoprotein. This sequence contains a 9 nucleotide
CC   insert compared to the PGP allelic variant given in AAF86127.

XX
CC   The present sequence represents mdr1-delta-F335, a gene encoding a
CC   cyclosporin-resistant deletion mutant of human P-glycoprotein lacking
CC   Phe335. The recombinant protein can be used to produce antibodies. It
CC   can also be used in drug screening assays to study the effects of
CC   modulators such as cyclosporin on P-glycoprotein-mediated drug efflux.
CC   The nucleic acid can be used to transfer modulator-resistant multidrug
CC   resistance into transfected cells, e.g. haematopoietic stem cells for
CC   use during cancer therapy.

      Pred. No. is the number of results predicted by chance to have a
      score greater than or equal to the score of the result being printed,
      and is derived by analysis of the total score distribution.

      Pred. No. is the number of results predicted by chance to have a
      score greater than or equal to the score of the result being printed,
      and is derived by analysis of the total score distribution.

; GENERAL INFORMATION:
;  APPLICANT: Frank, Markus
;  APPLICANT:  Sayegh, Mohamed
;  TITLE OF INVENTION: A Gene Encoding a Multidrug Resistance Human P-Glycoprotein
;  TITLE OF INVENTION:  Homologue on Chromosome 7p15-21 and Uses Thereof
;  FILE REFERENCE: 81994/268611
;  CURRENT APPLICATION NUMBER: US/09/873,409
;  CURRENT FILING DATE:  2001-06-05
;  NUMBER OF SEQ ID NOS: 19
;  SOFTWARE: PatentIn version 3.0
; SEQ ID NO 12

; Sequence 10, Application US/09873409
; Patent No. US20020037522A1
; GENERAL INFORMATION:
;  APPLICANT: Frank, Markus
;  APPLICANT:  Sayegh, Mohamed
;  TITLE OF INVENTION: A Gene Encoding a Multidrug Resistance Human P-Glycoprotein
;  TITLE OF INVENTION:  Homologue on Chromosome 7p15-21 and Uses Thereof
;  FILE REFERENCE: 81994/268611
;  CURRENT APPLICATION NUMBER: US/09/873,409
;  CURRENT FILING DATE:  2001-06-05
;  NUMBER OF SEQ ID NOS: 19
;  SOFTWARE: PatentIn version 3.0
; SEQ ID NO 10
;   LENGTH: 2856
;   TYPE: DNA
;   ORGANISM: Homo sapiens

     Pred. No. is the number of results predicted by chance to have a
     score greater than or equal to the score of the result being printed,
     and is derived by analysis of the total score distribution.

US-09-873-409-14
; Sequence 14, Application US/09873409
; Patent No. US20020037522A1
; GENERAL INFORMATION:
; APPLICANT: Frank, Markus
; APPLICANT: Sayegh, Mohamed
; TITLE OF INVENTION: A Gene Encoding a Multidrug Resistance Human P-Glycoprotein
; TITLE OF INVENTION: Homologue on Chromosome 7p15-21 and Uses Thereof
; FILE REFERENCE: 81994/268611
; CURRENT APPLICATION NUMBER: US/09/873,409
; CURRENT FILING DATE: 2001-06-05
; NUMBER OF SEQ ID NOS: 19
; SOFTWARE: PatentIn version 3.0
; SEQ ID NO 14
; LENGTH: 3621
; TYPE: DNA
; ORGANISM: Homo sapiens

; Sequence 2, Application US/09306417
; Patent No. US20020103144A1
; GENERAL INFORMATION:
; APPLICANT: Heinrich-Pette-Institut
; TITLE OF INVENTION: Retroviral Gene Transfer Vectors
; FILE REFERENCE: P50491
; CURRENT APPLICATION NUMBER: US/09/306,417
; CURRENT FILING DATE: 1999-05-06
; EARLIER APPLICATION NUMBER: DE 198 22 115
; EARLIER FILING DATE: 1998-05-08
; NUMBER OF SEQ ID NOS: 17
; SOFTWARE: PatentIn Ver. 2.0
; SEQ ID NO 2
; LENGTH: 8630
; TYPE: DNA
; ORGANISM: Artificial Sequence

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

            cDNA library was prepared and sequenced in Mouse Genome
            Encyclopedia Project of Genome Exploration Research Group in Riken
            Genomic Sciences Center and Genome Science Laboratory in RIKEN.
            Division of Experimental Animal Research in Riken contributed to
            prepare mouse tissues. First strand cDNA was primed with a primer
            [5' GAGAGAGAGAAGGATCCAAGAGCTCTTTTTTTTTTTTTTTTVN 3'], cDNA was
            prepared by using trehalose thermo-activated reverse transcriptase
            and subsequently enriched for full-length by cap-trapper. Second
            strand cDNA was prepared with the primer adapter of sequence [5'
            GAGAGAGAGATTCTCGAGTTAATTAAATTAATCCCCCCCCCCCC 3']. cDNA was cleaved
            with BamHI and XhoI. cDNA of size comprised between 3 and 7 kb was
            selected before cloning. Vector: a modified pBluescript KS(+) after
            bulk excision from Lambda FLC I. Cloning sites, 5' end: SalI; 3'
            end: BamHI. Host: DH10B.

            cDNA library was prepared and sequenced in Mouse Genome
            Encyclopedia Project of Genome Exploration Research Group in Riken
            Genomic Sciences Center and Genome Science Laboratory in RIKEN.
            Division of Experimental Animal Research in Riken contributed to
            prepare mouse tissues. First strand cDNA was primed with a primer
            [5' GAGAGAGAGAAGGATCCAAGAGCTCTTTTTTTTTTTTTTTTVN 3'], cDNA was
            prepared by using trehalose thermo-activated reverse transcriptase
            and subsequently enriched for full-length by cap-trapper. cDNA went
            through one round of normalization to Rot = 10.0 and subtraction to
            Rot = 185.2. Second strand cDNA was prepared with the primer
```

```
            adapter of sequence [5'
            GAGAGAGAGATTCTCGAGTTAATTAAATTAATCCCCCCCCCCCC 3']. cDNA was cleaved
            with BamHI and XhoI. Vector: a modified pBluescript KS(+) after
            bulk excision from Lambda FLC I. Cloning sites, 5' end: SalI; 3'
            end: BamHI. Host: DH10B.

      Pred. No. is the number of results predicted by chance to have a
      score greater than or equal to the score of the result being printed,
      and is derived by analysis of the total score distribution.

PT   New transporters and ion channels (TRICH) polypeptides, useful for
PT   diagnosing, preventing, and treating disorders associated with an
PT   abnormal expression or activity of TRICH, e.g. immunological, muscular
PT   or renal disorders  -
XX
PS   Claim 5; Page 172; 178pp; English.
XX
CC   The invention relates to human transporters and ion channels (TRICH)
CC   polypeptides, a naturally occurring amino acid sequence 90 % identical to
CC   TRICH, a biologically active fragment of TRICH or an immunogenic fragment
CC   of TRICH. Also included are an isolated polynucleotide encoding TRICH,
CC   a recombinant polynucleotide comprising a promoter sequence operably
CC   linked to the TRICH polynucleotide, a cell transformed with the
CC   recombinant polynucleotide, a transgenic organism comprising the
CC   recombinant polynucleotide, an isolated antibody that binds specifically
CC   to TRICH, and screening for compounds which bind to TRICH, modulate
CC   TRICH, modulate TRICH expression or are ant/agonists of TRICH.
CC   The polypeptides are useful for diagnosing, treating, and
CC   preventing transport, neurological, muscle, immunological disorders
CC   (e.g. scleroderma, systemic lupus erythematosus, allergies), cell
CC   proliferative disorders such as cancers (e.g. leukaemia, cervical or
CC   breast cancers), neurodegenerative disorders (e.g. Parkinson's disease,
CC   Alzheimer's disease), muscular disorders (e.g. myotonic dystrophy,
CC   catatonia), endocrine disorders (e.g. diabetes, Grave's disease),
CC   gastrointestinal disorders (e.g. Crohn's disease), renal disorders
CC   (e.g. Good pasture's syndrome), viral, bacterial, fungal, parasitic,
CC   protozoal and helminthic infections, cardiovascular disorders (e.g.
CC   atherosclerosis), or hepatic diseases (e.g. cirrhosis) and many
CC   other diseases and disorders detailed in the specification. They can also
CC   be used in assessing the effects of exogenous compounds on the
CC   expression of nucleic acid and amino acid sequences of transporters and
CC   ion channels. TRICH or its fragments may also be used in screening for
CC   compounds that specifically bind to and modulate the activity of TRICH.
CC   The polynucleotides can be used to create knock-in humanised animals or
CC   transgenic animals to model human disease. The present sequence
CC   encodes a TRICH protein.

XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) allelic variant
CC   (Genotype D) cDNA. The PGP enzyme functions as an efflux pump
CC   exporting small molecules across the cell membrane. This enzyme
CC   is a member of the ABC transporter family.

CC   This invention relates to a polynucleotide sequence encoding a
CC   cynomologous monkey P-glycoprotein (PGP), and an allelic variant of the
CC   PGP protein. PGP, also known as multidrug transporter, MDR1 is a member
CC   of the ABC transporter superfamily. The enzyme serves as an efflux pump
CC   exporting small molecules across the cell membrane. The invention
CC   includes a cynomologous monkey (Macaca fascicularis) PGP coding sequence
CC   and protein, and also that of an allelic variant. The PGP polynucleotide
CC   sequence is useful for increasing PGP transporter activity in a cell.
CC   Antisense sequences of the cDNA are useful for inhibiting PGP transport
CC   activity in a mammalian cell. They may also be used for increasing the
CC   bioavailability of a drug. The present sequence represents cDNA encoding
CC   cynomologous monkey P-glycoprotein. This sequence contains a 9 nucleotide
CC   insert compared to the PGP allelic variant given in AAF86127.

PS   Claim 10; Page 68-70; 113pp; English.
XX
CC   This sequence represents cDNA encoding human wild-type
CC   multidrug resistance protein MDR-1. MDR-1 is a transmembrane
CC   efflux pump, responsible for the export of drugs from cells,
CC   particularly cancer cells. Wild-type MDR-1 shows increased
CC   resistance to etoposide and decreased resistance to vinca
CC   alkaloids compared with a mutant form (AAY58187) where the Gly at
CC   position 185 is replaced by Val. The invention relates to transducing
CC   haematopoietic stem cells with nucleic acid encoding an MDR protein
CC   and culturing the modified cells. The modified haematopoietic stem
CC   cells are useful in bone marrow transplantation (to reconstitute
CC   haematopoietic systems in patients who have undergone chemotherapy or
CC   radiation therapy) and in ex vivo gene therapy of genetic defects in
CC   cells derived from haematopoietic stem cells, e.g., thalassaemia,
CC   Gauchier's disease, sickle cell anaemia or leukaemia. The modified
CC   cells can also be used to identify factors involved in regulating
CC   proliferation and differentiation in haematopoietic stem cells.
CC   Haematopoietic stem cells that express MDR-1 will be protected against
CC   chemotherapeutic agents, so can be engrafted while the patient is
CC   undergoing chemotherapy. Expansion of (rare) haematopoietic stem cells
CC   provides sufficient cells to permit standard biochemical analysis.
CC   Overexpression of MDR-1 allows cytokine-driven expansion of
CC   haematopoietic stem cells by at least 10-fold compared with a maximum
CC   of 4-fold in known procedures.

PT   Identifying a stem cell, for treating e.g., muscular dystrophy,

PS   Disclosure; Page 53-55; 87pp; English.
XX
CC   The invention provides a method of identifying and/or isolating a stem
CC   cell that involves detecting the expression of an ATP transport protein
CC   containing a conserved ATP-binding cassette (BCRP) by a cell in a sample
CC   comprising stem cells. The isolated stem cells may be used in the
CC   treatment of diseases such as muscular dystrophy, degenerative liver
CC   disorder, myocardial infarction, Parkinson's disease, degenerative
CC   disorders of the brain, and for tissue regeneration or replacement.
CC   Haematopoietic cells can be used in bone marrow transplants (e.g., for
CC   treatment of leukemia) and for ex vivo gene therapy for treating blood
CC   diseases such as sickle cell anemia and thalassemia. The stem cells can
CC   also be used as cell targets in gene therapy protocols. The present
CC   sequence represents a sequence related to the BCRP for which no relevant
CC   information has been provided in the specification.

XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) allelic variant
CC   (Genotype A) cDNA. The PGP enzyme functions as an efflux pump
CC   exporting small molecules across the cell membrane. This enzyme
CC   is a member of the ABC transporter family.

PT   New dog P-glycoproteins (PGP) and their encoding nucleic acids, useful

XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) allelic variant
CC   (Genotype B) cDNA. The PGP enzyme functions as an efflux pump
CC   exporting small molecules across the cell membrane. This enzyme
CC   is a member of the ABC transporter family.

CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) cDNA. This
CC   sequence is also referred as Genotype C cDNA. The
CC   PGP enzyme functions as an efflux pump exporting small molecules
CC   across the cell membrane. This enzyme is a member of the ABC
CC   transporter family.

PT   Novel isolated nucleic acid encoding cynomologous monkey P-glycoprotein
PT   (PGP) and homologous PGP polypeptides are useful for predicting

XX
CC   This invention relates to a polynucleotide sequence encoding a
CC   cynomologous monkey P-glycoprotein (PGP), and an allelic variant of the
CC   PGP protein. PGP, also known as multidrug transporter, MDR1 is a member
CC   of the ABC transporter superfamily. The enzyme serves as an efflux pump
CC   exporting small molecules across the cell membrane. The invention
CC   includes a cynomologous monkey (Macaca fascicularis) PGP coding sequence
CC   and protein, and also that of an allelic variant. The PGP polynucleotide
CC   sequence is useful for increasing PGP transporter activity in a cell.
CC   Antisense sequences of the cDNA are useful for inhibiting PGP transport
CC   activity in a mammalian cell. They may also be used for increasing the
CC   bioavailability of a drug. The present sequence represents cDNA encoding
CC   cynomologous monkey P-glycoprotein.

CC   This sequence represents cDNA encoding human G185V mutant multidrug
CC   resistance protein MDR-1, where the the Gly residue at postion 185
CC   of the wild-type protein (AAY58186) is replaced by Val. MDR-1 is a
CC   transmembrane efflux pump, responsible for the export of drugs from
CC   cells, particularly cancer cells. The wild-type MDR-1 shows increased
CC   resistance to etoposide and decreased resistance to vinca alkaloids
CC   compared with the G185V mutant. The invention relates to transducing
CC   haematopoietic stem cells with nucleic acid encoding an MDR protein
CC   and culturing the modified cells. The modified haematopoietic stem
CC   cells are useful in bone marrow transplantation (to reconstitute
CC   haematopoietic systems in patients who have undergone chemotherapy or
CC   radiation therapy) and in ex vivo gene therapy of genetic defects in
CC   cells derived from haematopoietic stem cells, e.g., thalassaemia,
CC   Gauchier's disease, sickle cell anaemia or leukaemia. The modified
CC   cells can also be used to identify factors involved in regulating
CC   proliferation and differentiation in haematopoietic stem cells.
CC   Haematopoietic stem cells that express MDR-1 will be protected against
CC   chemotherapeutic agents, so can be engrafted while the patient is
CC   undergoing chemotherapy. Expansion of (rare) haematopoietic stem cells
CC   provides sufficient cells to permit standard biochemical analysis.
CC   Overexpression of MDR-1 allows cytokine-driven expansion of
CC   haematopoietic stem cells by at least 10-fold compared with a maximum
CC   of 4-fold in known procedures.

PT   Identifying a stem cell, for treating e.g., muscular dystrophy,
PT   myocardial infarction, Parkinson's disease, or neurodegenerative
PT   disorders, comprises detecting the expression of an ATP transport
PT   protein (BCRP) by a cell -
XX
PS   Disclosure; Page 59-60; 87pp; English.
XX
CC   The invention provides a method of identifying and/or isolating a stem
CC   cell that involves detecting the expression of an ATP transport protein
CC   containing a conserved ATP-binding cassette (BCRP) by a cell in a sample
CC   comprising stem cells. The isolated stem cells may be used in the
CC   treatment of diseases such as muscular dystrophy, degenerative liver
CC   disorder, myocardial infarction, Parkinson's disease, degenerative
CC   disorders of the brain, and for tissue regeneration or replacement.
CC   Haematopoietic cells can be used in bone marrow transplants (e.g., for

```
CC   treatment of leukemia) and for ex vivo gene therapy for treating blood
CC   diseases such as sickle cell anemia and thalassemia. The stem cells can
CC   also be used as cell targets in gene therapy protocols. The present
CC   sequence represents a sequence related to the BCRP for which no relevant
CC   information has been provided in the specification.

XX
CC   AAH57161 to AAH57576 represent cell and tissue specific polynucleotide
CC   sequences (I). (I) can have cytostatic, immunomodulatory and
CC   neuroprotective activities, and can be used in gene therapy. (I) and
CC   proteins (II) encoded by then are used in high throughput screening
CC   assays to select DNA molecules, RNA molecules, peptide nucleic acids,
CC   mimetics, peptides, proteins, agonists, antagonists, antibodies or
CC   their fragments, immunoglobulins, inhibitors, drug compounds and
CC   pharmaceutical agents. Expression of (I) in a sample indicates the
CC   differentiation of embryonic stem cells into a tissue selected from
CC   brain, heart, kidney, liver, lung, skeletal muscle or pancreatic
CC   tissues. (I) and (II) are used to produce an expression profile that
CC   defines a metabolic or developmental process, treatment, condition,
CC   disease or disorder. The gene profile can be used for diagnosis,
CC   prognosis or monitoring of treatments and for investigating a
CC   predisposition to a disorder where the gene is associated with a
CC   cancer, immunopathology or neuropathology.

CC   The present sequence is that of human ATP binding cassette
CC   subfamily B protein ABCB1 cDNA.  The cDNA was identified using a
CC   differential display method in which monocytes from peripheral
CC   blood were subjected to macrophage differentiation and cholesterol
CC   loading with acetylated low density lipoproteins and subsequent
CC   deloading with high density lipoprotein (HDL3) to identify
CC   cholesterol sensitive genes.  The gene maps to chromosome 7q21
CC   and is also termed MDR1 (multidrug resistance).  The invention
CC   provides cholesterol-sensitive ABC genes (see AAZ94734-63).  These
CC   genes, and polypeptides encoded by them, can be used for diagnostic
CC   and therapeutic applications, and for biochemical or cell-based
CC   assays to screen for pharmacologically active modulator compounds
CC   useful for the treatment of lipid disorders, atherosclerosis or
CC   other inflammatory diseases such as psoriasis and lupus
CC   erythematosus.

CC   The invention relates to a method of treating a subject having or at
CC   risk of developing a haematologic malignancy or multidrug resistance
CC   (MDR). The method involves administering hypoxia inducible factor-1
CC   (HIF-1) binding molecules or small ubiquitin-like-modifier (SUMO)-1
CC   binding molecules or HIF-1-SUMO-1 complex modulators. mdr1-hypoxia
CC   responsive element (HRE) binding molecules or antisense nucleic
CC   acid molecules and SUMO-1 binding molecules or antisense molecules
CC   are useful for treating a subject having or at risk of developing
CC   haematologic malignancy or MDR (e.g. a lymphoid disorder or a myeloid
CC   disorder). The lymphoid disorders include lymphocytic leukaemia or
CC   chronic lymphoproliferative disorders e.g. lymphoma, myeloma or chronic
CC   lymphoid leukaemia. The myeloid disorders include chronic or acute
CC   myeloid leukaemia, e.g. angiogenic myeloid metaplasia, essential
CC   thrombocythaemia or polycythaemia vera. The invention is used in gene
CC   therapy. The present sequence is human mdr1 gene.

      Pred. No. is the number of results predicted by chance to have a
      score greater than or equal to the score of the result being printed,
      and is derived by analysis of the total score distribution.

; Sequence 12, Application US/09873409
; Patent No. US20020037522A1
; GENERAL INFORMATION:
; APPLICANT: Frank, Markus
; APPLICANT: Sayegh, Mohamed
; TITLE OF INVENTION: A Gene Encoding a Multidrug Resistance Human P-Glycoprotein
; TITLE OF INVENTION: Homologue on Chromosome 7p15-21 and Uses Thereof
; FILE REFERENCE: 81994/268611
; CURRENT APPLICATION NUMBER: US/09/873,409
; CURRENT FILING DATE: 2001-06-05
; NUMBER OF SEQ ID NOS: 19
; SOFTWARE: PatentIn version 3.0
; SEQ ID NO 12
; LENGTH: 3177
; TYPE: DNA
; ORGANISM: Homo sapiens
; FEATURE:
; NAME/KEY: No. US20020037522A1e
; LOCATION: (198)..(198)
; OTHER INFORMATION: n at position 198 represents any nucleotide (A, T, C or G)

      Pred. No. is the number of results predicted by chance to have a
      score greater than or equal to the score of the result being printed,
      and is derived by analysis of the total score distribution.

PT   New transporters and ion channels (TRICH) polypeptides, useful for
PT   diagnosing, preventing, and treating disorders associated with an
PT   abnormal expression or activity of TRICH, e.g. immunological, muscular
PT   or renal disorders  -
XX
PS   Claim 5; Page 172; 178pp; English.
XX
CC   The invention relates to human transporters and ion channels (TRICH)
CC   polypeptides, a naturally occurring amino acid sequence 90 % identical to
CC   TRICH, a biologically active fragment of TRICH or an immunogenic fragment
CC   of TRICH. Also included are an isolated polynucleotide encoding TRICH,
CC   a recombinant polynucleotide comprising a promoter sequence operably
CC   linked to the TRICH polynucleotide, a cell transformed with the
CC   recombinant polynucleotide, a transgenic organism comprising the
CC   recombinant polynucleotide, an isolated antibody that binds specifically
CC   to TRICH, and screening for compounds which bind to TRICH, modulate
CC   TRICH, modulate TRICH expression or are ant/agonists of TRICH.
CC   The polypeptides are useful for diagnosing, treating, and
CC   preventing transport, neurological, muscle, immunological disorders
CC   (e.g. scleroderma, systemic lupus erythematosus, allergies), cell
CC   proliferative disorders such as cancers (e.g. leukaemia, cervical or
CC   breast cancers), neurodegenerative disorders (e.g. Parkinson's disease,
CC   Alzheimer's disease), muscular disorders (e.g. myotonic dystrophy,
CC   catatonia), endocrine disorders (e.g. diabetes, Grave's disease),
CC   gastrointestinal disorders (e.g. Crohn's disease), renal disorders
CC   (e.g. Good pasture's syndrome), viral, bacterial, fungal, parasitic,
CC   protozoal and helminthic infections, cardiovascular disorders (e.g.
CC   atherosclerosis), or hepatic diseases (e.g. cirrhosis) and many
CC   other diseases and disorders detailed in the specification. They can also
CC   be used in assessing the effects of exogenous compounds on the
CC   expression of nucleic acid and amino acid sequences of transporters and
CC   ion channels. TRICH or its fragments may also be used in screening for
CC   compounds that specifically bind to and modulate the activity of TRICH.
CC   The polynucleotides can be used to create knock-in humanised animals or
CC   transgenic animals to model human disease. The present sequence
CC   encodes a TRICH protein.

XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) allelic variant
CC   (Genotype D) cDNA. The PGP enzyme functions as an efflux pump
CC   exporting small molecules across the cell membrane. This enzyme
CC   is a member of the ABC transporter family.

CC   This invention relates to a polynucleotide sequence encoding a
CC   cynomologous monkey P-glycoprotein (PGP), and an allelic variant of the
CC   PGP protein. PGP, also known as multidrug transporter, MDR1 is a member
CC   of the ABC transporter superfamily. The enzyme serves as an efflux pump
CC   exporting small molecules across the cell membrane. The invention
CC   includes a cynomologous monkey (Macaca fascicularis) PGP coding sequence
CC   and protein, and also that of an allelic variant. The PGP polynucleotide
CC   sequence is useful for increasing PGP transporter activity in a cell.
CC   Antisense sequences of the cDNA are useful for inhibiting PGP transport
CC   activity in a mammalian cell. They may also be used for increasing the
CC   bioavailability of a drug. The present sequence represents cDNA encoding
CC   cynomologous monkey P-glycoprotein. This sequence contains a 9 nucleotide
CC   insert compared to the PGP allelic variant given in AAF86127.

CC   This sequence represents cDNA encoding human wild-type
CC   multidrug resistance protein MDR-1. MDR-1 is a transmembrane
CC   efflux pump, responsible for the export of drugs from cells,
CC   particularly cancer cells. Wild-type MDR-1 shows increased
CC   resistance to etoposide and decreased resistance to vinca
CC   alkaloids compared with a mutant form (AAY58187) where the Gly at
CC   position 185 is replaced by Val. The invention relates to transducing
CC   haematopoietic stem cells with nucleic acid encoding an MDR protein
CC   and culturing the modified cells. The modified haematopoietic stem
CC   cells are useful in bone marrow transplantation (to reconstitute
CC   haematopoietic systems in patients who have undergone chemotherapy or
CC   radiation therapy) and in ex vivo gene therapy of genetic defects in
CC   cells derived from haematopoietic stem cells, e.g., thalassaemia,
CC   Gauchier's disease, sickle cell anaemia or leukaemia. The modified
CC   cells can also be used to identify factors involved in regulating
CC   proliferation and differentiation in haematopoietic stem cells.
CC   Haematopoietic stem cells that express MDR-1 will be protected against
CC   chemotherapeutic agents, so can be engrafted while the patient is
CC   undergoing chemotherapy. Expansion of (rare) haematopoietic stem cells
CC   provides sufficient cells to permit standard biochemical analysis.
CC   Overexpression of MDR-1 allows cytokine-driven expansion of
CC   haematopoietic stem cells by at least 10-fold compared with a maximum
CC   of 4-fold in known procedures.

PT   Identifying a stem cell, for treating e.g., muscular dystrophy,
PT   myocardial infarction, Parkinson's disease, or neurodegenerative
PT   disorders, comprises detecting the expression of an ATP transport
PT   protein (BCRP) by a cell  -

CC   The invention provides a method of identifying and/or isolating a stem
CC   cell that involves detecting the expression of an ATP transport protein
CC   containing a conserved ATP-binding cassette (BCRP) by a cell in a sample
CC   comprising stem cells. The isolated stem cells may be used in the
CC   treatment of diseases such as muscular dystrophy, degenerative liver
CC   disorder, myocardial infarction, Parkinson's disease, degenerative
CC   disorders of the brain, and for tissue regeneration or replacement.
CC   Haematopoietic cells can be used in bone marrow transplants (e.g., for
CC   treatment of leukemia) and for ex vivo gene therapy for treating blood
CC   diseases such as sickle cell anemia and thalassemia. The stem cells can
CC   also be used as cell targets in gene therapy protocols. The present
CC   sequence represents a sequence related to the BCRP for which no relevant
CC   information has been provided in the specification.

PS   Claim 9; Page 85-90; 111pp; English.
XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP .
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) allelic variant
CC   (Genotype A) cDNA. The PGP enzyme functions as an efflux pump
CC   exporting small molecules across the cell membrane. This enzyme
CC   is a member of the ABC transporter family.

PT   New dog P-glycoproteins (PGP) and their encoding nucleic acids, useful

PS   Claim 9; Page 93-99; 111pp; English.
XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) allelic variant
CC   (Genotype B) cDNA. The PGP enzyme functions as an efflux pump
CC   exporting small molecules across the cell membrane. This enzyme
CC   is a member of the ABC transporter family.

XX
PS   Claim 3; Page 58-63; 111pp; English.
XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) cDNA. This
CC   sequence is also referred as Genotype C cDNA. The
CC   PGP enzyme functions as an efflux pump exporting small molecules
CC   across the cell membrane. This enzyme is a member of the ABC
CC   transporter family.

PS   Claim 1; Page 66-72; 111pp; English.
XX
CC   The invention relates to dog P-glycoprotein (PGP) also referred
CC   as multidrug transporter (MDR1) and nucleic acids encoding them.
CC   The invention also includes fragments and biologically functional
CC   variants of dog P-glycoprotein. PGP and their nucleic acids are
CC   useful for determining the bioavailability of drugs and for
CC   screening PGP inhibitors. They are useful for the diagnosis and
CC   treatment of conditions characterised by PGP activity, by
CC   reducing or increasing PGP activity in a cell. PGP nucleic acids
CC   are used as oligonucleotide probes. Complements of PGP nucleic
CC   acids are useful as antisense oligonucleotides, to induce a PGP
CC   'knockout' phenotype. They are used to prepare a non-human
CC   transgenic animal, which are valuable as genetic models for
CC   human diseases.
CC   The present sequence is dog P-glycoprotein (PGP) cDNA. The
CC   PGP enzyme functions as an efflux pump exporting small molecules
CC   across the cell membrane. This enzyme is a member of the ABC
CC   transporter family.

XX
CC   This invention relates to a polynucleotide sequence encoding a
CC   cynomologous monkey P-glycoprotein (PGP), and an allelic variant of the
CC   PGP protein. PGP, also known as multidrug transporter, MDR1 is a member
CC   of the ABC transporter superfamily. The enzyme serves as an efflux pump
CC   exporting small molecules across the cell membrane. The invention
CC   includes a cynomologous monkey (Macaca fascicularis) PGP coding sequence
CC   and protein, and also that of an allelic variant. The PGP polynucleotide
CC   sequence is useful for increasing PGP transporter activity in a cell.
CC   Antisense sequences of the cDNA are useful for inhibiting PGP transport
CC   activity in a mammalian cell. They may also be used for increasing the
CC   bioavailability of a drug. The present sequence represents cDNA encoding
CC   cynomologous monkey P-glycoprotein.

CC   This sequence represents cDNA encoding human G185V mutant multidrug
CC   resistance protein MDR-1, where the the Gly residue at postion 185
CC   of the wild-type protein (AAY58186) is replaced by Val. MDR-1 is a
CC   transmembrane efflux pump, responsible for the export of drugs from
CC   cells, particularly cancer cells. The wild-type MDR-1 shows increased
CC   resistance to etoposide and decreased resistance to vinca alkaloids
CC   compared with the G185V mutant. The invention relates to transducing
CC   haematopoietic stem cells with nucleic acid encoding an MDR protein
CC   and culturing the modified cells. The modified haematopoietic stem
CC   cells are useful in bone marrow transplantation (to reconstitute
CC   haematopoietic systems in patients who have undergone chemotherapy or
CC   radiation therapy) and in ex vivo gene therapy of genetic defects in
CC   cells derived from haematopoietic stem cells, e.g., thalassaemia,
CC   Gauchier's disease, sickle cell anaemia or leukaemia. The modified
CC   cells can also be used to identify factors involved in regulating
CC   proliferation and differentiation in haematopoietic stem cells.
CC   Haematopoietic stem cells that express MDR-1 will be protected against
CC   chemotherapeutic agents, so can be engrafted while the patient is
CC   undergoing chemotherapy. Expansion of (rare) haematopoietic stem cells
CC   provides sufficient cells to permit standard biochemical analysis.
CC   Overexpression of MDR-1 allows cytokine-driven expansion of
CC   haematopoietic stem cells by at least 10-fold compared with a maximum
CC   of 4-fold in known procedures.

PT   Identifying a stem cell, for treating e.g., muscular dystrophy,
PT   myocardial infarction, Parkinson's disease, or neurodegenerative
PT   disorders, comprises detecting the expression of an ATP transport
PT   protein (BCRP) by a cell  -
XX
PS   Disclosure; Page 59-60; 87pp; English.
XX
CC   The invention provides a method of identifying and/or isolating a stem
CC   cell that involves detecting the expression of an ATP transport protein
CC   containing a conserved ATP-binding cassette (BCRP) by a cell in a sample
CC   comprising stem cells. The isolated stem cells may be used in the
CC   treatment of diseases such as muscular dystrophy, degenerative liver
CC   disorder, myocardial infarction, Parkinson's disease, degenerative
CC   disorders of the brain, and for tissue regeneration or replacement.
CC   Haematopoietic cells can be used in bone marrow transplants (e.g., for
CC   treatment of leukemia) and for ex vivo gene therapy for treating blood
CC   diseases such as sickle cell anemia and thalassemia. The stem cells can
CC   also be used as cell targets in gene therapy protocols. The present
CC   sequence represents a sequence related to the BCRP for which no relevant
CC   information has been provided in the specification.

XX
CC   AAH57161 to AAH57576 represent cell and tissue specific polynucleotide
CC   sequences (I). (I) can have cytostatic, immunomodulatory and
CC   neuroprotective activities, and can be used in gene therapy. (I) and
CC   proteins (II) encoded by then are used in high throughput screening
CC   assays to select DNA molecules, RNA molecules, peptide nucleic acids,
CC   mimetics, peptides, proteins, agonists, antagonists, antibodies or
CC   their fragments, immunoglobulins, inhibitors, drug compounds and
CC   pharmaceutical agents. Expression of (I) in a sample indicates the
CC   differentiation of embryonic stem cells into a tissue selected from
CC   brain, heart, kidney, liver, lung, skeletal muscle or pancreatic
CC   tissues. (I) and (II) are used to produce an expression profile that
CC   defines a metabolic or developmental process, treatment, condition,
CC   disease or disorder. The gene profile can be used for diagnosis,
CC   prognosis or monitoring of treatments and for investigating a
CC   predisposition to a disorder where the gene is associated with a
CC   cancer, immunopathology or neuropathology.

CC The present sequence is that of human ATP binding cassette
CC subfamily B protein ABCB1 cDNA. The cDNA was identified using a
CC differential display method in which monocytes from peripheral
CC blood were subjected to macrophage differentiation and cholesterol
CC loading with acetylated low density lipoproteins and subsequent
CC deloading with high density lipoprotein (HDL3) to identify
CC cholesterol sensitive genes. The gene maps to chromosome 7q21
CC and is also termed MDR1 (multidrug resistance). The invention
CC provides cholesterol-sensitive ABC genes (see AAZ94734-63). These
CC genes, and polypeptides encoded by them, can be used for diagnostic
CC and therapeutic applications, and for biochemical or cell-based
CC assays to screen for pharmacologically active modulator compounds

CC   The invention relates to a method of treating a subject having or at
CC   risk of developing a haematologic malignancy or multidrug resistance
CC   (MDR). The method involves administering hypoxia inducible factor-1
CC   (HIF-1) binding molecules or small ubiquitin-like-modifier (SUMO)-1
CC   binding molecules or HIF-1-SUMO-1 complex modulators. mdr1-hypoxia
CC   responsive element (HRE) binding molecules or antisense nucleic
CC   acid molecules and SUMO-1 binding molecules or antisense molecules
CC   are useful for treating a subject having or at risk of developing
CC   haematologic malignancy or MDR (e.g. a lymphoid disorder or a myeloid
CC   disorder). The lymphoid disorders include lymphocytic leukaemia or
CC   chronic lymphoproliferative disorders e.g. lymphoma, myeloma or chronic
CC   lymphoid leukaemia. The myeloid disorders include chronic or acute
CC   myeloid leukaemia, e.g. angiogenic myeloid metaplasia, essential
CC   thrombocythaemia or polycythaemia vera. The invention is used in gene
CC   therapy. The present sequence is human mdr1 gene.
